

Import Header.fxml and Sidemenu.fxml Tutorial

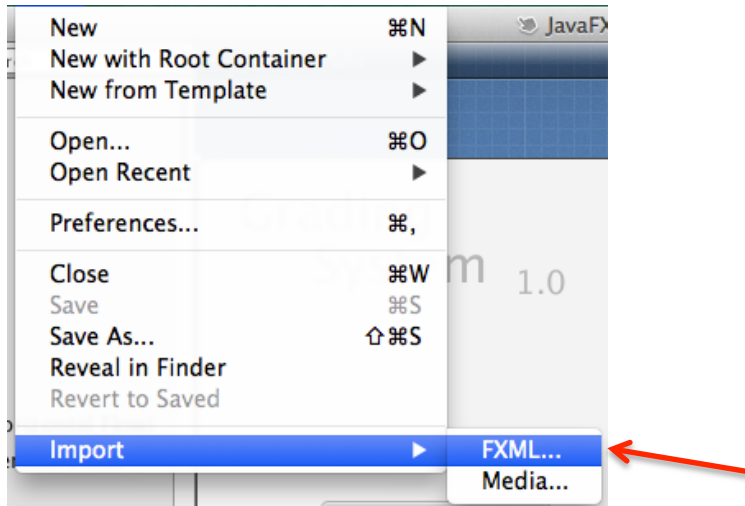

1. Set Page Size – Right now we are using 950px for width and 650px for height.

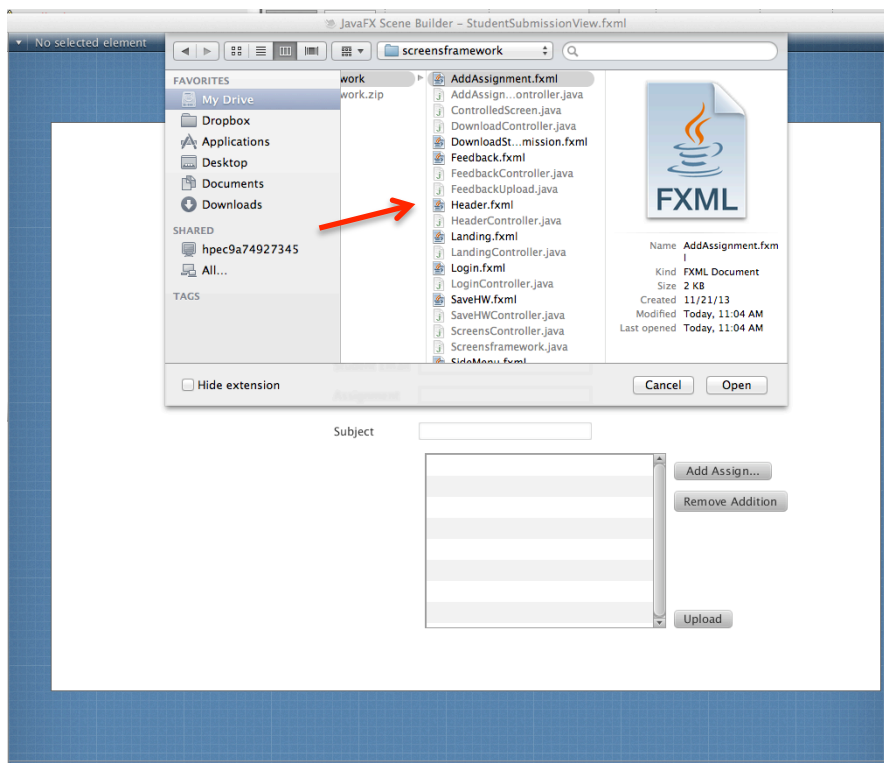

2. Position content to the approximate place you would like it.

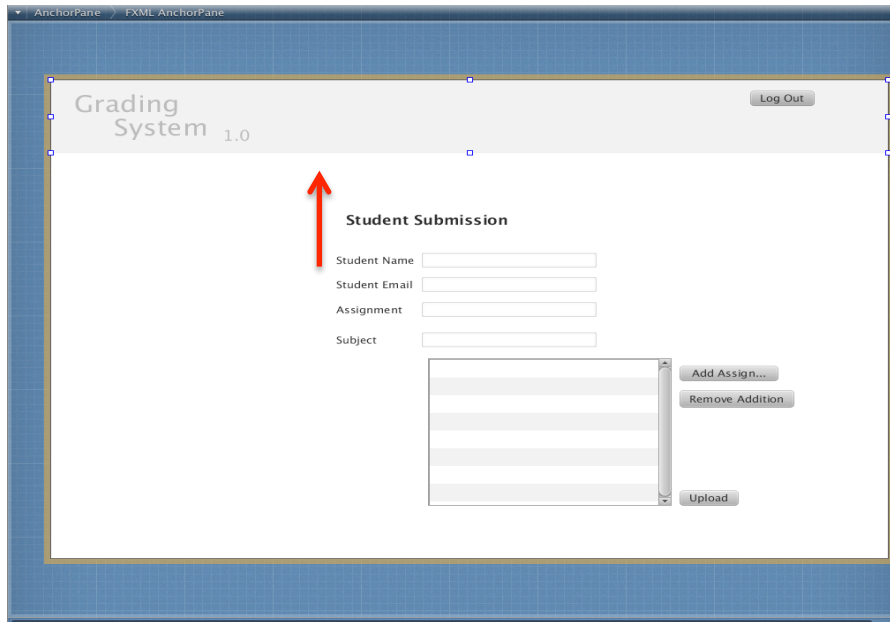

3. Select Import -> FXML.. from the file tab dropdown in SceneBuilder tool bar.

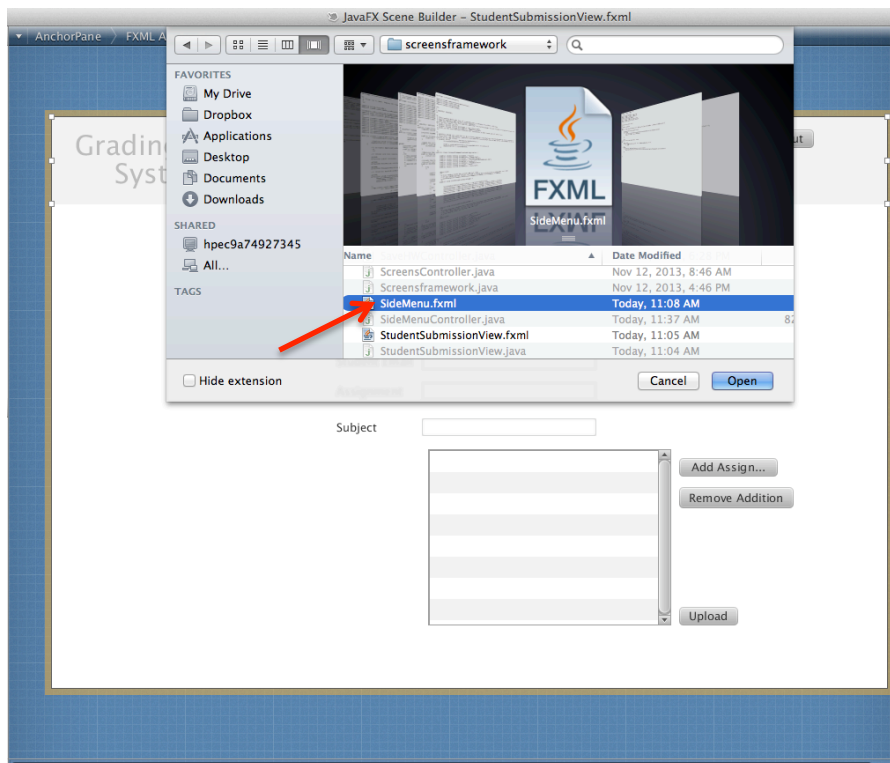

4. Choose Header.fxml to import the header into the page.

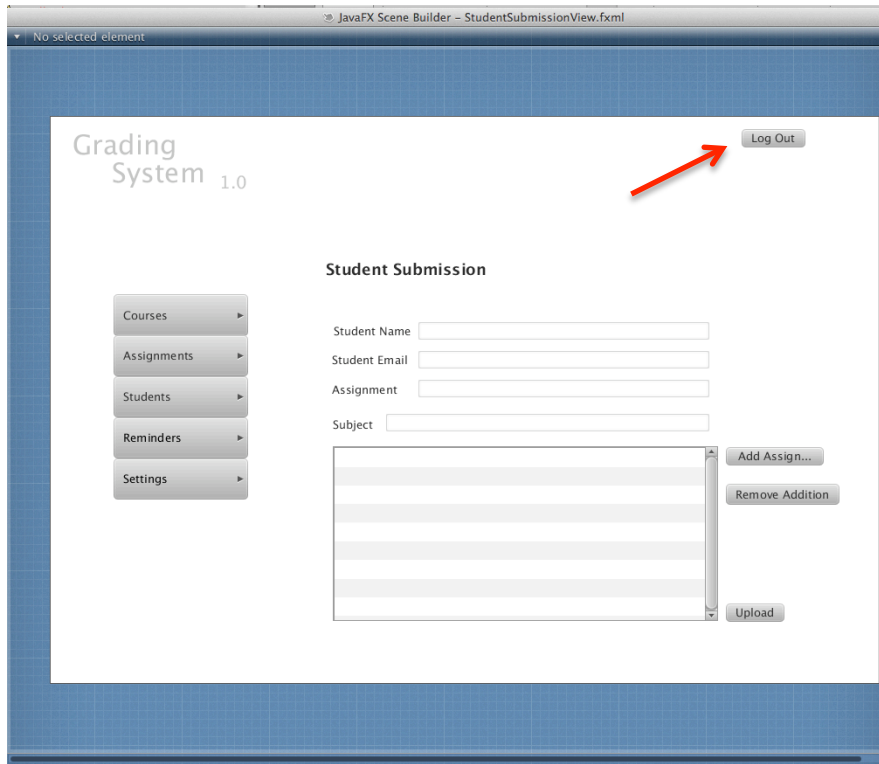

5. Position header to where you want it to be.

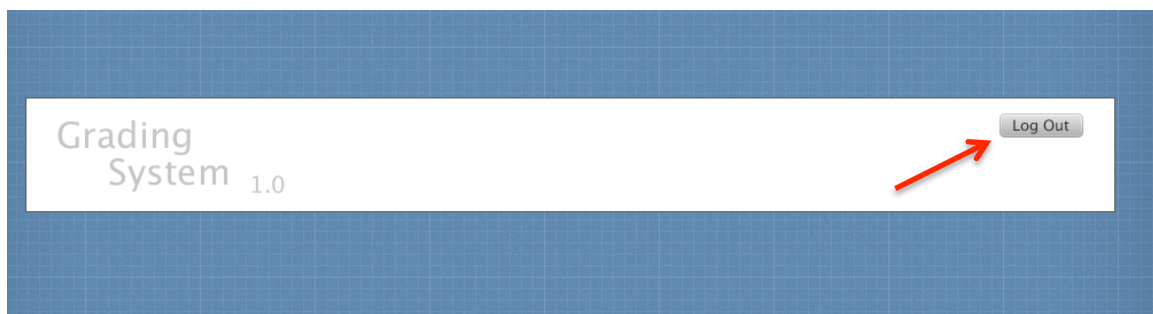

6. Select Sidemenu.fxml to import the side menu into the fxml.

7. Changes made to imported fxml files will reflect across files that have imported those fxml files.
Notice the position of the logout button.

8. Now we move the logout button in the Header.fxml .

9. The logout button changes position in all files that have Header.fxml imported into it.
Position content where desired. (I spread out the content to fill the space)
